

NO HAUL NO BURN

Specialized Forestry Solutions utilizes the latest in mulching technology to offer an affordable alternative to your present clearing needs. With the burn ban in effect and the rules by which woody debris can be disposed and the costs associated with such removal, we can save the owner/developer thousands of dollars on a typical work site.

Specialized Forestry Solutions is THE ONLY mulching contractor with this technology in the South East. We can come in to a site and clear your site from standing mature trees to ready to strip topsoil with only two pieces of equipment and two operators.

The Prime Tech Gator 350 clears the trees and stumps to ground level closely followed by our other piece of equipment which grinds the stumps, soft rock and debris 10' wide and up to 20" into the ground producing some of the finest topsoil around that can then be saved for the final grade. This topsoil retains all of the nutrients and the added benefit of the mulch organics mixed into the topsoil which in turn provides an excellent base to produce established stands of grass and or agricultural crops with a much higher success ratio than other means. Stands of pasture grasses have been found to resemble a five year growth establishment after only 8 to 12 months of growth. Specialized Forestry Solutions is truly your one stop resource for clearing and land maintenance programs. Please contact us for a demonstration today if you are interested in saving money and having a better finished product.

Utility Clearing Specialist

Specialized Forestry Solutions is a woman-owned business. We specialize in development and residential clearing. From one to fifteen hundred acres, no job is too small or large. We have several different sizes of equipment to handle your clearing needs. The C140 and the FTX130 can handle residential lot clearing as well as material up to 15". For sensitive areas (wetlands, creek banks or hillsides) we offer our Cat 321 excavator with various attachments to handle nearly any situation.

Specialized Forestry Solutions Offers...

- Land/Lot Clearing, Survey Lines (Surveyors and Landowners)
- Fence line construction (clearing for new fence lines)
- Trail construction
- Brush/Slash pile reduction
- Clear-cut/Logging cleanup
- Storm cleanup
- Hazard Fuel Reduction
- Diseased /Infested tree(s) removal (pine beetles, etc.)
- Pasture reclamation and any other woody material that you need to have removed.

Safe for the Environment

Our machines have very low ground pressure so as not to create ruts and unsightly tracks within the property. Mulching adds much needed moisture content and leaves the property with a "park like" effect. As we "cover as we go", there is no need to worry about runoff as the mulch covers the area, leaving little to no exposed dirt for an unsightly appearance or erosion.

Mulching Vs. Bulldozing

Mulching clears overgrown vegetation and restores property without the inherent dangers of burning or the expense of hauling to rid property of refuse. It increases property value through soil enrichment, water conservation and erosion control and can restore habitat and pasture without destruction to grasses, topsoil and desirable plant species. Since mulchers cut saplings and brush off at ground level, there are no stumps to burn or pull out.

Burning piles of brush get extremely hot and leave a scar at the site of the pile and in the surrounding area. They become so hot in fact, that they burn several inches below topsoil level, sterilizing the ground and killing everything in it. Topsoil contains vital nutrients, living microbes, oxygen and nitrogen that plants need to survive. Seeds germinating just beneath the soil are also destroyed during a burn. Scars from burn piles can cause soil sterilization and damage that can last for up to three years. The flames, heat and smoke from brush piles damage not only the immediate area but can also destroy damage and weaken nearby trees that are still standing. Many areas prohibit burning altogether due to the inherent dangers it presents and the amount of damage it causes to environmental balance.
